Supplementary Figure 1.Forest plot of estimated odds ratio (95% confidence intervals) for unadjusted (panel A) or fully adjusted (panel B) venous thromboembolism (VTE) of testosterone treatment (TTh) vs placebo, as derived from available pharmacoepidemiological studies. Panel C: forest plot of estimated odds ratio (95% confidence intervals) for fully adjusted VTE when events derived from the first six month of TTh in the Martinez et al., (63) study were considered. LL=lower limits; UP= upper limits.
